

Meeting assets for Review—CPFR CPH Portal Wireframes are ready!

Meeting summary

Quick recap

The team discussed the design and functionality of a new CPH (Customer Portal Hub) interface, focusing on whether the proposed MVP (Minimum Viable Product) would meet vendor needs and encourage adoption. Steven raised concerns that the current design might not provide enough value to justify vendors using the platform instead of their existing email reports, while Nathan and Phanindher emphasized the need for visualizations and metrics that would engage users and demonstrate accountability. The group agreed that a scorecard-style landing page should be the primary focus, with interactive elements and daily updates to keep vendors engaged. They decided to review existing successful vendor visualizations and metrics to inform the design, with Nathan committing to follow up with ISMs (Internal Supply Managers) to gather best practices for creating an effective interface.

Next steps

- [Nathan: Collect examples of highly effective vendor-facing visuals and scorecards currently used in CPFR discussions \(including from Henry and others\), and reach out to relevant ISMs to gather best practices and feedback.](#)
- [Nathan: Create a mockup/wireframe of the new landing page focused on a visual executive summary/scorecard for vendor use, incorporating collected best practices, by next week.](#)
- [Nathan: Schedule and conduct a follow-up meeting for next Friday to review the new landing page wireframe with the team.](#)
- [Nathan: Send out emails to team/ISMs to request input on effective vendor connects and best practice visuals to inform the new landing page design.](#)
- [Team \(Nathan, Steven, and others as needed\): Review the wireframe of the landing page in the next meeting and provide feedback.](#)

Summary

Vendor Platform UX Design Review

The team discussed UX design requirements for a vendor management platform, focusing on functionality for vendor access and report management. Nathan shared that Aaron had presented designs featuring vendor-specific interfaces, check boxes for programs, and user management capabilities. Nathaniel raised questions about whether the designs met all needs, particularly regarding alerts and Tableau integration, and noted that these designs needed to be reviewed by Palmer before being included in a paper. The team also discussed the need to determine if Aaron could develop additional design templates and whether they could secure a CPH engineer for development.

CPH Vendor Portal MVP Discussion

Nathan discussed the differences between MVP and end goals for a CPH vendor portal, emphasizing that while a database could handle tier assignments, a self-administration interface for vendors is necessary. He shared

documents reflecting the MVP requirements for a functional and feedback-capable portal presence in CPH. Nathan introduced a wireflow layout for review and asked the team to assess whether it encapsulated their discussed needs, identify any misses, or cause concerns.

CPH Report Repository Strategy

The team discussed concerns about CPH becoming a report repository, with Steven questioning how to differentiate it from email reports that vendors might not want to stop receiving. Nathan clarified that while turning off emails was considered, it's now a "no-go," but forecast emails will continue. He presented a mock-up of the tier viewer, which would allow real-time data access similar to Tableau, and discussed potential enhancements like alerting systems and interactive features that need to be included in the MVP for proper ROI calculation.

Supply Chain Vendor Accountability Initiative

Nathan and Nathaniel discussed the importance of accountability in supply chain management, emphasizing the need to shift responsibility from buyers to vendors. They highlighted the benefits of housing data in CPH and creating monitoring mechanisms to track vendor access and compliance. Steven acknowledged this and noted that an API integration in the future could further enhance accountability and make email communications optional for certain vendors.

Enhancing Vendor Platform with Visualizations

The team discussed enhancing their platform by adding a summary page with visualizations and heat maps to provide more value to vendors, similar to the Amazon Partner Portal. Steven emphasized the need for an MVP that includes these features, as current Excel-based offerings may not be sufficient. Nathan presented a rough draft of a landing page for a scorecard, suggesting that the standalone CPFR download page might be unnecessary. They considered integrating key metrics directly on the scorecard to improve user experience and decision-making.

Vendor Platform Development Strategy

The team discussed the development of a vendor platform, with Steven expressing concerns about the difficulty of getting vendors to adopt new systems and the need for meaningful data visualization to engage users. They explored how to make the platform more useful than existing solutions, with Nathaniel and Nathan focusing on how to ensure ISMs can enforce accountability through the platform. Steven emphasized that vendors respond well to visual data presentations, suggesting this should be a key feature of the platform, while noting that current resources might limit the scope of the initial MVP.

Vendor Scorecard Landing Page Development

The team discussed creating a vendor scorecard landing page in CPH, with Steven emphasizing the need for a visual executive summary that vendors can use for their own leadership discussions. Phanindher suggested adding automated email alerts for ISMs to highlight key triggers, while Nathan proposed reviewing existing successful visual examples and creating a mockup within a week. The team agreed to focus on a scorecard-first approach with daily updates, tailored metrics per vendor tier, and visually engaging elements like heat maps for location-based data.
